Assignment

We are supposed to mess around with the Processing sketch that is connected with the ESP32 sketch. We had to create an interactive sketch that was controlled by a button and an LDR/Potentiometer with the addition of timers

Reflections

This assignment was difficult at first because I did not really have any ideas of what to do for a timer in the first place. I wanted to add sound to this sketch but I had a hard time playing a song after a timer ended. I want to get that issue resolved for the upcoming project!
